

Framework Specification

Component Specification: OBJECTIVE

Version	1.0
Framework	OPRMT™ (Objective • Parameters • Results • Method • Tools)
Author	Michael Willis Fleming
Classification	Prompt Engineering Standard
Field	Prompt Compliance Engineering (PCE)
Date	March 15, 2026
Document ID	OBJ-OPRMT-SPEC-001

CONTENTS

Table of Contents

1.	Purpose
2.	Definition
3.	Structural Requirements
4.	Objective Syntax Model
5.	Compliance Rules
6.	Quality Criteria
7.	Scoring — DOAS Integration
8.	Validated Examples
9.	Validation Checklist
10.	Implementation Guidance
11.	Compliance Identifier
12.	Summary

SECTION 1

Purpose

The Objective defines the primary intent of a prompt within the OPRMT™ Framework. It establishes the core directive that the AI system must achieve, serving as the foundational anchor for all subsequent components: Parameters, Results, Method, and Tools.

A properly defined Objective ensures:

- Clarity of intent across all downstream components
- Precise task alignment between operator instruction and AI execution
- Predictable and reproducible output generation
- Measurable prompt success within the DOAS™ scoring system

Architectural Note: Without a clearly defined Objective, prompts become ambiguous, inefficient, and non-deterministic. The Objective is the sole element that governs the entire prompt execution chain.

SECTION 2

Definition

Objective (OBJ)

A structured statement that defines the exact task, goal, or action the AI must perform. The Objective must clearly answer the operational question:

"What must the AI accomplish?"

It is the primary operational directive within a prompt. The Objective component carries the designation **OBJ-OPRMT** within all compliance and version control documentation.

SECTION 3

Structural Requirements

A valid Objective must contain the following three structural elements. Omission of any element constitutes a structural compliance failure.

3.1 Action Directive

The Objective must specify a clear verb-based instruction. The action verb establishes the operational mode for AI execution.

Approved action verbs include:

Create	Analyze	Generate	Explain	Design
Evaluate	Summarize	Translate	Produce	Develop

Create a structured certification curriculum for prompt engineering.

3.2 Target Subject

The Objective must identify the specific subject or entity being acted upon. The Target Subject answers the question: *acted upon what?*

Create a structured certification curriculum for prompt engineering. Target Subject = certification curriculum

3.3 Scope Definition

The Objective must define the operational scope or context of the task. The Scope qualifier prevents overreach and constrains output dimensions.

Create a structured 10-module certification curriculum for prompt engineering professionals. Scope = 10-module curriculum | Audience = professionals

SECTION 4

Objective Syntax Model

The OPRMT™ Framework prescribes the following canonical syntax model for Objective construction:

[Action Verb] + [Target Subject] + [Scope or Context]

Applied example:

Design a professional prompt engineering certification course using the OPRMT™ framework.

This syntax model ensures structural consistency across all library assets and compliance scoring evaluations.

SECTION 5

Objective Compliance Rules

To meet OPRMT™ Objective Compliance, all three rules below must be satisfied. Violation of any single rule results in a non-compliant classification.

Rule 1 — Single Core Task

The Objective must represent one primary directive. Compound objectives that span multiple unrelated tasks are non-compliant.

COMPLIANT	NON-COMPLIANT
Create a structured prompt library for business automation.	Create a prompt library and also design a website and write a book.

Rule 2 — Explicit Intent

Objectives must avoid vague or hedged language. The directive must convey deterministic intent without requiring interpretation.

AVOID	USE INSTEAD
"help with"	"create / produce"
"do something about"	"analyze / evaluate"
"make better"	"optimize / restructure"

Rule 3 — Task-Oriented Output

The Objective must require an actionable, producible output. Informational inquiries without production directives are non-compliant.

COMPLIANT	NON-COMPLIANT
Explain prompt engineering principles for beginner AI users.	Tell me about prompt engineering.

SECTION 6

Objective Quality Criteria

A high-quality Objective must satisfy all four quality attributes. These attributes are evaluated independently within the DOAS™ scoring system.

Attribute	Description	Standard
-----------	-------------	----------

Clarity	Clearly understandable task directive	Unambiguous verb + subject
Specificity	Defines both subject and operational scope	Scope qualifier present
Actionability	Requires a measurable, producible output	Output implied or stated
Determinism	Minimizes interpretation ambiguity	Single directive only

SECTION 7

Objective Scoring — DOAS Integration

Within the DOAS™ Prompt Quality Scoring System, the Objective component is evaluated on a 0–20 point scale. This score contributes directly to the overall Deterministic Compliance Index (DCI™) calculation.

Score Range	Classification	Description
0 – 5	Non-Compliant	Vague or absent objective; no measurable output defined
6 – 10	Marginal	Basic directive present but scope is unclear or incomplete
11 – 15	Compliant	Clear directive with defined subject; minor scope gaps
16 – 20	Fully Compliant	Highly precise objective with explicit task, subject, and scope

Prompts scoring below 11 on the Objective component cannot achieve a Fully Compliant classification at the framework level, regardless of performance in other components.

SECTION 8

Validated Examples

The following examples demonstrate compliant Objective construction across three operational domains.

Example 1 — Content Creation

Objective: Write a professional blog article explaining prompt engineering best practices for enterprise AI operators.

Example 2 — Business Automation

Objective: Generate a reusable prompt template for automating customer support responses across e-commerce platforms.

Example 3 — Education & Certification

Objective: Design a 10-module certification course teaching the OPRMT™ prompt engineering framework to intermediate AI practitioners.

SECTION 9

Objective Validation Checklist

Before a prompt is classified as compliant, the following validation checklist must be confirmed in full. A single unchecked item constitutes a compliance gap.

■	Contains an explicit action verb
■	Identifies the target subject of the task
■	Defines the operational scope or context
■	Represents a single, primary directive
■	Produces a clearly measurable output

SECTION 10

Implementation Guidance

When constructing prompts using the OPRMT™ Framework, the Objective must always be authored first. This enforces intent-first prompt architecture, which directly improves output reliability and reproducibility.

Recommended Prompt Construction Order

1	OBJECTIVE — Define the primary task directive
2	PARAMETERS — Specify constraints and input variables
3	RESULTS — Define expected output format and success criteria
4	METHOD — Establish execution logic and reasoning steps
5	TOOLS — Identify frameworks, models, and systems required

This ordering ensures that every downstream component inherits its operational context from a precisely defined Objective, eliminating systemic ambiguity across the entire prompt architecture.

SECTION 11

Compliance Identifier

Within OPRMT™ documentation and version control systems, Objectives are referenced using the following standardized identifier format:

```
OBJ - OPRMT - {SEQUENCE_NUMBER}
```

Example reference:

```
OBJ - OPRMT - 001
```

This identifier must appear in prompt metadata, GitHub commit messages, and all PCE audit records associated with the Objective component.

SECTION 12

Summary

The Objective is the foundational directive of the OPRMT™ prompt architecture. It defines what must be accomplished, enabling all other framework components to operate with precision, alignment, and verifiable compliance.

A well-formed Objective directly improves:

- AI output quality and consistency
- Prompt reproducibility across operators and platforms
- System-level efficiency in multi-prompt workflows
- Prompt compliance scoring within the DOAS™ framework
