

OPRMT™ Student Certification Manual

Student Operations, Assessment, and Credential Use Standard

Document ID	OPRMT-CERT-STUDENT-MANUAL-1.0.0
Version	v1.0.0
Release Date	April 19, 2026
Owner	Michael W. Fleming
Support	engineering@oprmt.solutions

This manual defines the student operating standard for the OPRMT™ certification pathway. It is intended for use during enrollment, coursework, practical execution, final review, and credential maintenance.

Official Site: oprmt.solutions

Document Control

Use of this manual. This document is the student-facing reference for program rules, execution standards, assessment logic, and certificate-use controls.

Control Item	Approved Value
Document Title	OPRMT™ Student Certification Manual
Document Subtitle	Student Operations, Assessment, and Credential Use Standard
Document ID	OPRMT-CERT-STUDENT-MANUAL-1.0.0
Version	v1.0.0
Release Date	April 19, 2026
Program Owner	Michael W. Fleming
Official Site	oprmt.solutions
Support Contact	engineering@oprmt.solutions
Primary Audience	Enrolled students, instructors, reviewers, and administrators
Framework Basis	OPRMT™ v1.0 training architecture

1. Document Control and Authority

This manual establishes the student-facing operating standard for the OPRMT™ certification program.

- Applies to enrolled students, reviewers, instructors, and administrators working within the current certification edition.
- Assumes a ten-module learning path aligned to the OPRMT™ framework and associated compliance expectations.
- Controls student conduct, assessment logic, submission standards, certificate issuance, and permitted credential use.
- Should be read together with the current curriculum map, assignment instructions, and program notices.

2. Program Purpose and Credential Scope

The certification program is designed to train students to engineer prompts and prompt systems as structured technical assets rather than ad hoc text inputs.

- Teach students to apply the OPRMT™ framework in a repeatable, auditable manner.

- Develop operational skill in defining objectives, constraints, output requirements, procedures, and tool chains.
- Train students to produce outputs that are versioned, testable, and suitable for business or technical deployment.
- Introduce certification-level discipline in documentation, reproducibility, compliance, and evidence-based evaluation.

3. Expected Student Outcomes

By the end of the program, a successful student should be able to do the following:

- Translate an abstract request into a structured OPRMT™ prompt with explicit assumptions and enforceable requirements.
- Differentiate concept, framework, implementation, and execution within a prompt-driven workflow.
- Create prompts that specify acceptable outputs, failure conditions, validation criteria, and tool usage rules.
- Produce documentation and deliverables suitable for client work, internal use, product packaging, or public release.
- Defend prompt design decisions using structure, rationale, and evidence instead of intuition alone.

4. Certification Architecture

The certification pathway is organized as a staged learning system. Each module has its own lesson, worksheet, and evidence requirements.

- Module 0 establishes orientation, terminology, student rules, and workspace setup.
- Modules 1-5 train the five core OPRMT™ components as distinct engineering disciplines.
- Modules 6-8 move from component mastery into assembly, compliance, and applied system execution.
- Module 9 requires a capstone project and final certification review before a credential can be issued.

Curriculum Map

The module structure below should be used as the student's baseline roadmap.

Module	Title	Primary Competency	Required Deliverables
M0	Orientation and Foundations	Program rules, terminology, student workflow, workspace setup	Orientation acknowledgment, setup checklist
M1	Objective Engineering	Translate requests into clear goals, scope, and success conditions	Objective worksheet, rewritten prompt objective block
M2	Parameters Engineering	Define constraints, variables, inputs, exclusions, and guardrails	Parameter matrix, constrained prompt build
M3	Results Engineering	Specify desired outputs, schemas, quality thresholds, and acceptance tests	Output definition sheet, acceptance criteria

Module	Title	Primary Competency	Required Deliverables
M4	Method Engineering	Sequence procedure, logic, reasoning flow, validation, and correction steps	Method design worksheet, procedural prompt
M5	Tools Engineering	Declare tools, sources, model behaviors, and execution dependencies	Tooling plan, model/tool integration prompt
M6	Prompt Assembly and Architecture	Assemble complete multi-part prompts and reusable system assets	Integrated OPRMT™ prompt package
M7	Prompt Compliance Engineering Introduction	Evaluate structure, compliance, traceability, and policy fit	Compliance review worksheet, remediation notes
M8	Applied Systems Execution	Deploy OPRMT™ in real workflows, operations, products, or client scenarios	Applied scenario build, evidence log
M9	Capstone and Final Review	Demonstrate end-to-end competency and defend design choices	Capstone package, final review submission

5. Student Operating Standards

Students are expected to operate with professional discipline throughout the program.

- Follow the current assignment instructions exactly and use the required naming conventions.
- Submit work in the required format, with evidence of revision where revision is requested.
- Label assumptions, dependencies, external tools, and unsupported claims explicitly.
- Protect confidential, proprietary, or client-sensitive information at all times.
- Maintain version control over their own work and keep source files for audit or review when requested.

6. Assessment and Progression Model

Certification is performance-based. Completion alone is not sufficient; the student must meet the defined quality threshold.

- Orientation requirements must be completed before graded module work is counted.
- Each module includes knowledge verification and applied production evidence.
- A student must maintain passing performance across quizzes, worksheets, practical builds, and final review.
- Critical integrity or compliance violations may override numeric scores and block certification issuance.

Assessment Standard

Assessment Element	Weight	What Is Evaluated	Minimum Standard
Orientation Completion	Required gate	Program rules acknowledged; workspace and templates prepared	Must be complete before graded progression
Module Quizzes	20%	Core terminology, framework logic, standards, and application rules	80% minimum average
Worksheets and Labs	30%	Component-level execution and structured reasoning evidence	Passing across required modules
Practical Prompt Builds	25%	Operational prompt construction and revision quality	Reviewer-approved quality threshold
Final Exam	10%	Integrated knowledge verification across the framework	85% minimum
Capstone	15%	End-to-end system build, evidence, and defense	Approval required; no critical violations

7. Submission and Artifact Standards

Student work is evaluated as an engineered artifact. Every submission must be readable, reproducible, and properly packaged.

- Use the required file names, module identifiers, and version labels.
- Separate prompt content, implementation notes, test inputs, and resulting outputs when the assignment requires it.
- Where appropriate, include metadata such as use case, target model, audience, constraints, and expected output schema.
- Do not submit vague drafts, unsupported claims, or outputs that cannot be traced back to a defined objective and method.

Artifact Quality Baseline

Requirement	Student Rule
File Naming	Use module code, asset type, and version number in the filename
Metadata	State use case, intended audience, target model or tool, and version
Traceability	Show how the final output maps back to objective, parameters, and results
Reproducibility	Include method steps, test inputs, and any critical execution notes

Requirement	Student Rule
Professional Format	Deliver readable, organized files suitable for review or client handoff

8. Academic Integrity and Approved AI Use

This program teaches AI work; therefore AI use is permitted only within the assignment rules and must not replace student accountability.

- Students may use approved AI tools for drafting, testing, comparison, and iteration when the assignment allows it.
- Students remain responsible for final accuracy, structure, originality, and compliance.
- Undisclosed copying, resale of another person's work, fabricated validation, or false performance claims are prohibited.
- Where assistance materially shaped the result, the student must disclose the tool or source and the role it played.

Critical Integrity Violations

- Submitting another person's work as your own
- Falsifying test results, scores, or review history
- Using undisclosed assistance where disclosure was required
- Claiming certification before formal issuance
- Using the credential to imply unauthorized affiliation or authority

9. Capstone and Final Certification Review

The capstone functions as the final demonstration of competency. It must prove that the student can build and defend a complete OPRMT™ system under review.

- The capstone must solve a real or realistic business, technical, operational, or educational problem.
- The final package must include the prompt system, supporting rationale, validation approach, and resulting outputs.
- Reviewers may require revision, resubmission, or oral or written clarification before approving certification.
- A capstone that is operationally impressive but structurally noncompliant does not pass by default.

10. Certificate Issuance and Credential Use

Certificates are issued only after all mandatory requirements have been satisfied and final review has been approved.

- The certificate recognizes successful completion of the stated certification edition and framework version.
- It does not guarantee employment, legal licensure, regulatory approval, or authority beyond the defined program scope.
- Students may reference the credential in resumes, profiles, proposals, and service materials only using the exact approved credential name.

- Certificates may be suspended or revoked for fraud, material misrepresentation, or prohibited credential use.

Credential Use Matrix

Use Category	Policy
Permitted Uses	Resume listings, bios, portfolios, proposals, service pages, and internal capability records using the exact approved credential title.
Restricted Uses	Implying legal licensure, regulatory certification, corporate partnership, agency authority, or ownership rights not separately granted.
Prohibited Uses	Editing the certificate, selling the credential itself, misreporting version status, or claiming certification before issuance.
Version Rule	The holder should reference the certification edition or framework version when material to the claim or engagement.

11. Support, Communications, and Student Records

Program operations require clean communication and reliable recordkeeping.

- Students should use the official support channel for administrative, technical, or certification questions.
- Feedback and review notes should be preserved as part of the student's working record when revisions are required.
- Students are responsible for retaining their own copies of submissions, evidence, and final approved deliverables.
- The program may maintain records related to enrollment, submissions, assessment, issuance status, and disciplinary decisions.

Appendix A. Student Workspace Standard

Recommended folder map. Students should keep a clean workspace so assignments, revisions, and evidence can be reviewed without confusion.

Folder	Purpose
01_Orientation	Orientation acknowledgement, manual, rules, onboarding checklist
02_Worksheets	Component worksheets and structured learning exercises
03_Labs	Applied module work and practice outputs
04_Prompt_Builds	Integrated prompts, revisions, and validation tests
05_Capstone	Capstone drafts, evidence, review notes, and final package
06_Certification_Record	Exam result, approval notes, and issued certificate copy

Appendix B. Pre-Submission Checklist

- ☐ The objective is stated in one precise sentence and matches the assignment scope.
- ☐ Key parameters are explicit: audience, constraints, inputs, exclusions, and assumptions.
- ☐ The required result is measurable and formatted for evaluation.
- ☐ The method is sequenced and includes correction or validation behavior where needed.
- ☐ Required tools or sources are declared; prohibited tools are excluded.
- ☐ The file is named correctly and versioned.
- ☐ The submission is readable, organized, and free from unsupported claims.
- ☐ Supporting evidence is attached when the task requires tests, outputs, or rationale.

Appendix C. Core Glossary

Term	Definition
Objective	The explicit target the prompt or system is intended to achieve.
Parameters	Constraints, inputs, conditions, variables, exclusions, and operating limits.
Results	The required output form, quality level, acceptance criteria, and expected deliverable state.
Method	The ordered process the system should follow to generate or validate the output.
Tools	Models, sources, files, automations, or external systems allowed or required for execution.
Compliance	Conformance to defined structure, rules, standards, and assignment requirements.
Capstone	The final integrated project used to verify end-to-end certification readiness.
Version Control	The practice of tracking revisions so the current approved artifact can be identified and audited.
